(Received January 8, 2002 – Revised March 11, 2002)

We obtain a characterization of strict Jacobi–Nijenhuis structures using the equivalent notions of generalized Lie bialgebroid and Jacobi bialgebroid.

**Keywords:** Jacobi–Nijenhuis manifold, Poisson–Nijenhuis manifold, Lie algebroid, Lie bialgebroid.

## 1. Introduction

The notion of Jacobi–Nijenhuis manifold was introduced in [12] by J. C. Marrero, J. Monterde and E. Padrón as a generalization of the weak Poisson–Nijenhuis structure presented in [13]. In this work we introduce the notion of *strict* Jacobi–Nijenhuis manifold, which seems to be the natural generalization of the definition of Poisson–Nijenhuis manifold initially given by F. Magri and C. Morosi in [11].

When a Poisson manifold  $(M, \Lambda)$  is equipped with a Nijenhuis tensor  $N$ , we can associate with this manifold two Lie algebroid structures defined respectively on the tangent and on the cotangent bundles of  $M$ . Using the notion of Lie bialgebroid, which was introduced by K. Mackenzie and P. Xu in [10], Y. Kosmann-Schwarzbach showed in [7] that  $(M, \Lambda, N)$  is a Poisson–Nijenhuis manifold if and only if these two Lie algebroids constitute a Lie bialgebroid. Our aim is to show that a similar relation can be obtained when a differentiable manifold is equipped with a Jacobi structure and a Nijenhuis operator. For this purpose, we will use the notion of generalized Lie bialgebroid, introduced by D. Iglesias and J. C. Marrero in [2]. This notion is equivalent to the one introduced by J. Grabowski and G. Marmo in [1], under the name of Jacobi bialgebroid. Generalized Lie bialgebroids are closely related to Jacobi structures. In fact, it was proved in [2] that with each Jacobi manifold one can associate, in a certain manner, a generalized Lie bialgebroid and that the base manifold of a generalized Lie bialgebroid possesses a Jacobi structure.

Similar results to those found in this paper were obtained, independently, in [3].

Presented during the conference “Multi-Hamiltonian Structures: Geometric and Algebraic Aspects”, 9–17 August 2001, in Mathematical Conference Center in Będlewo, Poland.

## 2. Lie bialgebroids and Poisson–Nijenhuis manifolds

A *Lie algebroid*  $(A, [\cdot, \cdot], \rho)$  over a manifold  $M$  is a vector bundle  $A$  over  $M$  together with a bundle map  $\rho : A \rightarrow TM$  and a Lie algebra structure  $[\cdot, \cdot]$  on the space  $\Gamma(A)$  of the global cross sections such that

- (i) the map  $\Gamma(\rho) : \Gamma(A) \rightarrow \mathfrak{X}(M)$ , induced by  $\rho$ , is a Lie algebra homomorphism;
- (ii) for any  $f \in C^\infty(M)$  and  $X, Y \in \Gamma(A)$ ,

$$[X, fY] = f[X, Y] + (\Gamma(\rho)(X).f)Y.$$

The map  $\rho$  is called the *anchor map* and usually  $\Gamma(\rho)$  is denoted by  $\rho$ .

It is well known [8] that with each Lie algebroid  $(A, [\cdot, \cdot], \rho)$  a differential  $d$  on the graded space of sections of  $\Lambda A^* = \bigoplus_{k \in \mathbb{Z}} \Lambda^k A^*$  is associated, where  $A^*$  is the dual vector bundle of  $A$ . More precisely,  $d$  is a derivation of degree 1 and of square 0 of the associative graded commutative algebra  $(\Gamma(\Lambda A^*), \wedge)$ . Also the Lie bracket on  $\Gamma(A)$  can be extended to the algebra of sections of  $\Lambda A$ ,  $\Gamma(\Lambda A) = \bigoplus_{k \in \mathbb{Z}} \Gamma(\Lambda^k A)$ . The result is a graded Lie bracket  $[\cdot, \cdot]$  which is called the *Schouten bracket* of the Lie algebroid.

Suppose that the vector bundle  $(A, [\cdot, \cdot], \rho)$  and its dual vector bundle  $(A^*, [\cdot, \cdot]_*, \rho_*)$  are both Lie algebroids over a manifold  $M$ . Let  $d$  (resp.  $d_*$ ) denote the differential of  $A$  (resp.  $A^*$ ). The pair  $(A, A^*)$  is a *Lie bialgebroid* [10] if for all  $X, Y \in \Gamma(A)$ ,

$$d_*[X, Y] = [d_*X, Y] + [X, d_*Y]. \quad (1)$$

(Equivalently,  $(A, A^*)$  is a Lie bialgebroid if  $d_*$  is a derivation of  $(\Gamma(\Lambda A), [\cdot, \cdot])$ , see [6]).

This notion is self-dual, in the sense that if  $(A, A^*)$  is a Lie bialgebroid so is  $(A^*, A)$ , cf. [6, 10].

**EXAMPLE 1.** Let  $(M, \Lambda)$  be a Poisson manifold and  $\Lambda^\sharp : T^*M \rightarrow TM$  the vector bundle morphism given by  $\langle \beta, \Lambda^\sharp(\alpha) \rangle = \Lambda(\alpha, \beta)$  for all 1-forms  $\alpha$  and  $\beta$  in  $M$ . Then the pair  $((T^*M, [\cdot, \cdot]_\Lambda, \Lambda^\sharp), (TM, [\cdot, \cdot], \text{Id}_{TM}))$  is a Lie bialgebroid over  $M$ , where  $[\cdot, \cdot]_\Lambda$  is the Lie bracket of 1-forms given, for all  $\alpha, \beta \in \Omega^1(M)$ , by

$$[\alpha, \beta]_\Lambda = \mathcal{L}_{\Lambda^\sharp(\alpha)}\beta - \mathcal{L}_{\Lambda^\sharp(\beta)}\alpha - d(\Lambda(\alpha, \beta)). \quad (2)$$

The differential of  $(TM, [\cdot, \cdot], \text{Id}_{TM})$  is the de Rham differential, while the differential of  $(T^*M, [\cdot, \cdot]_\Lambda, \Lambda^\sharp)$  is the Lichnerowicz–Poisson differential  $d_\Lambda = [\Lambda, \cdot]$

The previous example shows a relation between Poisson manifolds and Lie bialgebroids. Another link relating these two structures is the following [10]: if  $(A, A^*)$  is a Lie bialgebroid over  $M$ , there exists on  $M$  an induced Poisson structure,

$$\{f, h\} = \langle df, d_*h \rangle, \quad f, h \in C^\infty(M).$$

**DEFINITION 1.** [11] A *Poisson–Nijenhuis manifold*  $(M, \Lambda, N)$  is a Poisson manifold  $(M, \Lambda)$  equipped with a tensor field  $N$  of type  $(1, 1)$  with vanishing Nijenhuis torsion, i.e. a Nijenhuis tensor, satisfying the following compatibility conditions:

- (i)  $N\Lambda^\sharp = \Lambda^\sharp \iota N$  and  
(ii)  $C(\Lambda, N) = 0$ , where

$$C(\Lambda, N)(\alpha, \beta) = [\alpha, \beta]_{N\Lambda} - [\iota N\alpha, \beta]_\Lambda - [\alpha, \iota N\beta]_\Lambda + \iota N[\alpha, \beta]_\Lambda, \quad (3)$$

for all  $\alpha, \beta \in \Omega^1(M)$ ,  $\iota N$  stands for the transpose of  $N$  and  $[\cdot, \cdot]_\Lambda$  (resp.  $[\cdot, \cdot]_{N\Lambda}$ ) is the bracket (2) associated with  $\Lambda$  (resp.  $N\Lambda$ ).

We should remark that condition (ii) of Definition 1 can be weakened, as it was done in [13], to obtain the so-called *weak Poisson–Nijenhuis manifold*.

It is well known [8] that when  $N$  is a Nijenhuis tensor on  $M$ , the triple  $(TM, [\cdot, \cdot]_N, N)$  is a Lie algebroid, where  $[\cdot, \cdot]_N$  is given by

$$[X, Y]_N = [NX, Y] + [X, NY] - N[X, Y], \quad X, Y \in \mathfrak{X}(M). \quad (4)$$

The next theorem gives a characterization of Poisson–Nijenhuis manifolds using the notion of Lie bialgebroid.

**THEOREM 1.** [7] *Let  $(M, \Lambda)$  be a Poisson manifold and  $N$  a Nijenhuis tensor on  $M$ . Then  $(M, \Lambda, N)$  is a Poisson–Nijenhuis manifold if and only if the pair*

$$((TM, [\cdot, \cdot]_N, N), (T^*M, [\cdot, \cdot]_\Lambda, \Lambda^\sharp))$$

*is a Lie bialgebroid.*

### 3. Jacobi bialgebroids and Jacobi manifolds

We recall that a Jacobi structure on a manifold  $M$  is a pair  $(\Lambda, E)$ , where  $\Lambda$  is a bivector and  $E$  is a vector field such that  $[\Lambda, \Lambda] = -2E \wedge \Lambda$  and  $[E, \Lambda] = 0$ .

Let  $(M, \Lambda, E)$  be a Jacobi manifold. Denote by  $(\Lambda, E)^\sharp : T^*M \times \mathbb{R} \rightarrow TM \times \mathbb{R}$  the vector bundle morphism given by  $(\Lambda, E)^\sharp(\alpha, f) = (\Lambda^\sharp(\alpha) + fE, -\langle \alpha, E \rangle)$ , for any section  $\alpha$  of  $T^*M$  and  $f \in C^\infty(M)$ . In opposition to the case of a Poisson manifold, in general one cannot define a Lie algebroid structure on the cotangent bundle of a Jacobi manifold. However, in [5] it was shown that if  $(M, \Lambda, E)$  is a Jacobi manifold, then  $(T^*M \times \mathbb{R}, [\cdot, \cdot]_{(\Lambda, E)}, \pi \circ (\Lambda, E)^\sharp)$  is a Lie algebroid over  $M$ , where  $\pi : T^*M \times \mathbb{R} \rightarrow T^*M$  is the projection over the first factor and  $[\cdot, \cdot]_{(\Lambda, E)}$  is the bracket given by

$$[(\alpha, f), (\beta, h)]_{(\Lambda, E)} := (\gamma, r), \quad (5)$$

with

$$\gamma := \mathcal{L}_{\Lambda^\sharp(\alpha)}\beta - \mathcal{L}_{\Lambda^\sharp(\beta)}\alpha - d(\Lambda(\alpha, \beta)) + f\mathcal{L}_E\beta - h\mathcal{L}_E\alpha - i_E(\alpha \wedge \beta),$$

$$r := -\Lambda(\alpha, \beta) + \Lambda(\alpha, dh) - \Lambda(\beta, df) + \langle fdh - hdf, E \rangle.$$

The associated differential  $d_*$  is given for all  $(P, Q) \in \mathcal{V}^k(M) \oplus \mathcal{V}^{k-1}(M)$  by [4]

$$d_*(P, Q) = ([\Lambda, P] + kE \wedge P + \Lambda \wedge Q, -[\Lambda, Q] + (1 - k)E \wedge Q + [E, P]), \quad (6)$$

where  $\mathcal{V}^k(M) = \Gamma(\Lambda^k(TM))$ .

On the other hand, if  $M$  is a differentiable manifold, then the triple  $(TM \times \mathbb{R}, [, ], \pi)$  is a Lie algebroid over  $M$ , where  $\pi$  is the projection over the first factor and  $[, ]$  is given by

$$[(X, f), (Z, h)] = ([X, Z], X \cdot h - Z \cdot f), \quad (X, f), (Z, h) \in \mathfrak{X}(M) \times C^\infty(M). \quad (7)$$

The associated differential is  $d = (d, -d)$ ,  $d$  being the de Rham differential.

When  $(M, \Lambda, E)$  is a Jacobi manifold, a natural question that arises is whether the pair  $(T^*M \times \mathbb{R}, TM \times \mathbb{R})$  is a Lie bialgebroid. The answer is no! This situation motivated the introduction, by D. Iglesias and J. C. Marrero [2], of the generalized Lie bialgebroids. The definition of generalized Lie bialgebroid was recently recast in simpler terms by J. Grabowski and G. Marmo in [1], under the name of Jacobi bialgebroid.

Let  $(A, [, ], \rho)$  be a Lie algebroid over  $M$  and  $\theta \in \Gamma(A^*)$  a 1-cocycle for the Lie algebroid cohomology complex with trivial coefficients (see [9]), i.e. for all  $X, Z \in \Gamma(A)$ ,

$$\theta([X, Z]) = \rho(X) \cdot (\theta(Z)) - \rho(Z) \cdot (\theta(X)). \quad (8)$$

Using the 1-cocycle  $\theta$ , we can define a new representation  $\rho^\theta$  of the Lie algebra  $(\Gamma(A), [, ])$  on  $C^\infty(M)$ , by setting

$$\rho^\theta : \Gamma(A) \times C^\infty(M) \rightarrow C^\infty(M), \quad (X, f) \mapsto \rho^\theta(X, f) = \rho(X) \cdot f + \theta(X)f. \quad (9)$$

Therefore, we obtain a new cohomology complex, whose differential cohomology operator is given by

$$d^\theta : \Gamma(\Lambda^k A^*) \rightarrow \Gamma(\Lambda^{k+1} A^*), \quad \beta \mapsto d^\theta(\beta) = d\beta + \theta \wedge \beta. \quad (10)$$

Also, for any  $X \in \Gamma(A)$ , the Lie derivative operator with respect to  $X$  is given by

$$\mathcal{L}_X^\theta : \Gamma(\Lambda^k A^*) \rightarrow \Gamma(\Lambda^k A^*), \quad \beta \mapsto \mathcal{L}_X^\theta(\beta) = \mathcal{L}_X \beta + \theta(X)\beta. \quad (11)$$

It is also possible to consider a  $\theta$ -Schouten bracket on the graded algebra  $\Gamma(\Lambda A)$ , denoted by  $[, ]^\theta$ , which is defined as follows:

$$[, ]^\theta : \Gamma(\Lambda^p A) \times \Gamma(\Lambda^q A) \rightarrow \Gamma(\Lambda^{p+q-1} A) \\ (P, Q) \mapsto [P, Q]^\theta = [P, Q] + (p-1)P \wedge (i_\theta Q) + (-1)^p(q-1)(i_\theta P) \wedge Q. \quad (12)$$

Suppose that  $(A, [, ], \rho)$  is a Lie algebroid over  $M$  such that in the dual bundle  $A^*$  of  $A$  there also exists a Lie algebroid structure over  $M$ ,  $([, ]_*, \rho_*)$ . Let  $\theta \in \Gamma(A^*)$  (resp.  $W \in \Gamma(A)$ ) be a 1-cocycle in the Lie algebroid cohomology complex of  $(A, [, ], \rho)$  (resp.  $(A^*, [, ]_*, \rho_*)$ ).

**DEFINITION 2.** [2] The pair  $((A, \theta), (A^*, W))$  is a *generalized Lie bialgebroid* if for all  $X, Z \in \Gamma(A)$  and  $P \in \Gamma(\Lambda^p A)$ ,

1.  $d_*^W[X, Z] = [d_*^W X, Z]^\theta + [X, d_*^W Z]^\theta$ ;
2.  $(\mathcal{L}_*^W)_\theta(P) + (\mathcal{L}^\theta)_W(P) = 0$ .

DEFINITION 3. [1] The pair  $((A, \theta), (A^*, W))$  is a *Jacobi bialgebroid* if for all  $P \in \Gamma(\Lambda^p A)$  and  $Q \in \Gamma(\Lambda A)$ ,

$$d_*^W[P, Q]^\theta = [d_*^W P, Q]^\theta + (-1)^{p+1}[P, d_*^W Q]^\theta.$$

The equivalence of Definitions 2 and 3 was proved in [1]. Consequently, generalized Lie bialgebroids and Jacobi bialgebroids designate exactly the same structure. When  $\theta = 0$  and  $W = 0$ , the Jacobi bialgebroid is a Lie bialgebroid.

Let  $(M, \Lambda, E)$  be a Jacobi manifold and let us consider the two Lie algebroids  $(T^*M \times \mathbb{R}, [, ]_{(\Lambda, E)}, \pi \circ (\Lambda, E)^\sharp)$  and  $(TM \times \mathbb{R}, [, ], \pi)$  mentioned above. Then  $\theta = (0, 1)$  (resp.  $W = (-E, 0)$ ) is a 1-cocycle of  $TM \times \mathbb{R}$  (resp.  $T^*M \times \mathbb{R}$ ) and the pair  $((TM \times \mathbb{R}, \theta), (T^*M \times \mathbb{R}, W))$  is a Jacobi bialgebroid.

Similar to the relation between Lie bialgebroids and Poisson manifolds, whenever  $((A, \theta), (A^*, W))$  is a Jacobi bialgebroid over  $M$ , there exists on  $M$  an induced Jacobi structure given by [2]:

$$\{f, h\} = \langle d^\theta f, d_*^W h \rangle, \quad f, h \in C^\infty(M). \quad (13)$$

#### 4. Jacobi bialgebroids and strict Jacobi-Nijenhuis manifolds

Let  $M$  be a  $C^\infty$ -differentiable manifold and  $\mathcal{N} : \mathfrak{X}(M) \times C^\infty(M) \rightarrow \mathfrak{X}(M) \times C^\infty(M)$  a  $C^\infty(M)$ -linear map defined, for all  $(X, f) \in \mathfrak{X}(M) \times C^\infty(M)$ , by

$$\mathcal{N}(X, f) = (NX + fY, \langle \gamma, X \rangle + gf), \quad (14)$$

where  $N$  is a tensor field of type  $(1, 1)$  on  $M$ ,  $Y \in \mathfrak{X}(M)$ ,  $\gamma \in \Omega^1(M)$  and  $g \in C^\infty(M)$ .  $\mathcal{N} := (N, Y, \gamma, g)$  can be considered as a vector bundle map,  $\mathcal{N} : TM \times \mathbb{R} \rightarrow TM \times \mathbb{R}$ . We may define the *Nijenhuis torsion*  $\mathcal{T}(\mathcal{N})$  of  $\mathcal{N}$  with respect to the Lie bracket (7). When  $\mathcal{T}(\mathcal{N})$  vanishes identically, we say that  $\mathcal{N}$  is a *Nijenhuis operator* on  $M$ .

Suppose now that  $M$  is equipped with a Jacobi structure  $(\Lambda, E)$  and a Nijenhuis operator  $\mathcal{N}$  and consider a tensor field  $\Lambda_1$  of type  $(2, 0)$  and a vector field  $E_1$  on  $M$ , defined by

$$(\Lambda_1, E_1)^\# = \mathcal{N} \circ (\Lambda, E)^\#. \quad (15)$$

DEFINITION 4. A *strict Jacobi-Nijenhuis manifold*  $(M, (\Lambda, E), \mathcal{N})$  is a Jacobi manifold  $(M, \Lambda, E)$  with a Nijenhuis operator  $\mathcal{N}$  satisfying the following compatibility conditions: (i)  $\mathcal{N} \circ (\Lambda, E)^\# = (\Lambda, E)^\# \circ {}^t\mathcal{N}$  and (ii)  $\mathcal{C}((\Lambda, E), \mathcal{N}) = 0$ , where

$$\begin{aligned} \mathcal{C}((\Lambda, E), \mathcal{N})((\alpha, f), (\beta, h)) &= [(\alpha, f), (\beta, h)]_{(\Lambda_1, E_1)} - [{}^t\mathcal{N}(\alpha, f), (\beta, h)]_{(\Lambda, E)} \\ &\quad - [(\alpha, f), {}^t\mathcal{N}(\beta, h)]_{(\Lambda, E)} + {}^t\mathcal{N}[(\alpha, f), (\beta, h)]_{(\Lambda, E)}, \end{aligned} \quad (16)$$

for all  $(\alpha, f), (\beta, h) \in \Omega^1(M) \times C^\infty(M)$ ,  ${}^t\mathcal{N}$  is the transpose of  $\mathcal{N}$  and  $[, ]_{(\Lambda, E)}$  (resp.  $[, ]_{(\Lambda_1, E_1)}$ ) is the bracket (5) associated with  $(\Lambda, E)$  (resp.  $(\Lambda_1, E_1)$ ).

For more details on (strict) Jacobi–Nijenhuis manifolds, see [12] and [14].

There exists a close relation between Poisson–Nijenhuis and strict Jacobi–Nijenhuis manifolds, as the next Proposition illustrates.

**PROPOSITION 2.** [14] *With each strict Jacobi–Nijenhuis manifold  $(M, (\Lambda, E), \mathcal{N})$ ,  $\mathcal{N} := (N, Y, \gamma, g)$ , a Poisson–Nijenhuis manifold  $(\tilde{M}, \tilde{\Lambda}, \tilde{N})$  can be associated, where  $(\tilde{M}, \tilde{\Lambda})$  is the Poissonization of  $(M, \Lambda, E)$ , i.e.  $\tilde{M} = M \times \mathbb{R}$  and  $\tilde{\Lambda} = e^{-t}(\Lambda + \frac{\partial}{\partial t} \wedge E)$ , and  $\tilde{N}$  is the Nijenhuis tensor field on  $\tilde{M}$ , given by  $\tilde{N} = N + Y \otimes dt + \frac{\partial}{\partial t} \otimes \gamma + g \frac{\partial}{\partial t} \otimes dt$ , and conversely ( $t$  is the usual coordinate on  $\mathbb{R}$ ).*

Let us now consider a differentiable manifold equipped with a Nijenhuis operator  $\mathcal{N} := (N, Y, \gamma, g)$ , given by (14). Using the operator  $\mathcal{N}$ , we may define a new bracket on  $\mathfrak{X}(M) \times C^\infty(M)$ , which is a deformation of the bracket (7), by setting, for all  $(X, f), (Z, h) \in \mathfrak{X}(M) \times C^\infty(M)$ ,

$$[(X, f), (Z, h)]_{\mathcal{N}} = [\mathcal{N}(X, f), (Z, h)] + [(X, f), \mathcal{N}(Z, h)] - \mathcal{N}[(X, f), (Z, h)]. \quad (17)$$

Since the Nijenhuis torsion  $\mathcal{T}(\mathcal{N})$  of  $\mathcal{N}$  vanishes, the bracket  $[\cdot, \cdot]_{\mathcal{N}}$  is a Lie bracket on  $\mathfrak{X}(M) \times C^\infty(M)$  and  $(TM \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}, \pi \circ \mathcal{N})$  is a Lie algebroid over  $M$ , where  $\pi : TM \times \mathbb{R} \rightarrow TM$  is the projection over the first factor.

The differential of the Lie algebroid  $(TM \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}, \pi \circ \mathcal{N})$  is  $d_{\mathcal{N}} = [i_{\mathcal{N}}, d]$ , where  $[\cdot, \cdot]$  is the graded commutator,  $d = (d, -d)$  with  $d$  the de Rham differential and  $i_{\mathcal{N}}$  is the derivation of degree zero defined, for all  $(\beta, \alpha) \in \Omega^k(M) \oplus \Omega^{k-1}(M)$ , by

$$\begin{aligned} i_{\mathcal{N}}(\beta, \alpha)((X_1, f_1), \dots, (X_k, f_k)) \\ = \sum_{i=1}^k (\beta, \alpha)((X_1, f_1), \dots, \mathcal{N}(X_i, f_i), \dots, (X_k, f_k)), \\ (X_1, f_1), \dots, (X_k, f_k) \in \mathfrak{X}(M) \times C^\infty(M). \end{aligned} \quad (18)$$

**PROPOSITION 3.** *The pair  $(\gamma, g) \in \Omega^1(M) \times C^\infty(M)$  is a 1-cocycle of the Lie algebroid  $(TM \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}, \pi \circ \mathcal{N})$ .*

*Proof:* Let  $(X, f)$  and  $(Z, h)$  be any sections of  $\mathfrak{X}(M) \times C^\infty(M)$ . A straightforward computation, using the fact that the Nijenhuis torsion of  $\mathcal{N}$  is zero, leads to

$$\begin{aligned} (\gamma, g)([(X, f), (Z, h)]_{\mathcal{N}}) &= (NX + fY).((\gamma, Z) + gh) - (NZ + hY).((\gamma, X) + fg) \\ &= (\pi \circ \mathcal{N})(X, f).((\gamma, g), (Z, h))) \\ &\quad - (\pi \circ \mathcal{N})(Z, h).((\gamma, g), (X, f))). \end{aligned}$$

Note that  $(\gamma, g) = {}^t\mathcal{N}(0, 1)$ . □

Before giving our main theorem, we need to review some results from [2]. Given a Lie algebroid  $(A, [\cdot, \cdot], \rho)$  over  $M$ , let us consider the vector bundle  $\tilde{A} = A \times \mathbb{R} \rightarrow$

$M \times \mathbb{R}$  over  $M \times \mathbb{R}$ . The sections of  $\tilde{A}$  can be identified with the  $t$ -dependent sections of  $A$ ,  $t$  being the canonical coordinate on  $\mathbb{R}$ , i.e. for any  $\tilde{X} \in \Gamma(\tilde{A})$  and  $(x, t) \in M \times \mathbb{R}$ ,  $\tilde{X}(x, t) = \tilde{X}_t(x)$ , where  $\tilde{X}_t \in \Gamma(A)$ . This identification induces, in a natural way, a Lie bracket on  $\Gamma(\tilde{A})$ , also denoted by  $[\cdot, \cdot]$ :

$$[\tilde{X}, \tilde{Z}](x, t) = [\tilde{X}_t, \tilde{Z}_t](x), \quad \tilde{X}, \tilde{Z} \in \Gamma(\tilde{A}), \quad (x, t) \in M \times \mathbb{R},$$

and a bundle map, also denoted by  $\rho$ ,  $\rho : \tilde{A} \rightarrow T(M \times \mathbb{R}) \equiv TM \oplus T\mathbb{R}$ , in such a way that  $(\tilde{A}, [\cdot, \cdot], \rho)$  becomes a Lie algebroid over  $M \times \mathbb{R}$ .

Now, take a 1-cocycle  $\theta \in \Gamma(A^*)$  and consider the following new brackets on  $\Gamma(\tilde{A})$ :

$$[\tilde{X}, \tilde{Z}]^{*\theta} = \exp(-t) \left( [\tilde{X}, \tilde{Z}] + \theta(\tilde{X}) \left( \frac{\partial \tilde{Z}}{\partial t} - \tilde{Z} \right) - \theta(\tilde{Z}) \left( \frac{\partial \tilde{X}}{\partial t} - \tilde{X} \right) \right) \quad (19)$$

and

$$[\tilde{X}, \tilde{Z}]^{-\theta} = [\tilde{X}, \tilde{Z}] + \theta(\tilde{X}) \frac{\partial \tilde{Z}}{\partial t} - \theta(\tilde{Z}) \frac{\partial \tilde{X}}{\partial t}, \quad (20)$$

$\tilde{X}, \tilde{Z} \in \Gamma(\tilde{A})$ . Also consider the maps  $\rho^{*\theta}, \rho^{-\theta} : \Gamma(\tilde{A}) \rightarrow \mathcal{V}^1(M \times \mathbb{R})$  given, for any  $\tilde{X} \in \Gamma(\tilde{A})$ , respectively by

$$\rho^{*\theta}(\tilde{X}) = \exp(-t) \left( \rho(\tilde{X}) + \theta(\tilde{X}) \frac{\partial}{\partial t} \right) \quad (21)$$

and

$$\rho^{-\theta}(\tilde{X}) = \rho(\tilde{X}) + \theta(\tilde{X}) \frac{\partial}{\partial t}. \quad (22)$$

LEMMA 4. [2] Let  $A \rightarrow M$  be a vector bundle over  $M$ ,  $[\cdot, \cdot] : \Gamma(A) \times \Gamma(A) \rightarrow \Gamma(A)$  a bracket on  $\Gamma(A)$ ,  $\rho : \Gamma(A) \rightarrow \mathfrak{X}(M)$  a homomorphism of  $C^\infty(M)$ -modules and  $\theta$  a section of the dual bundle  $A^*$ . Then the following conditions are equivalent:

- (i)  $(A, [\cdot, \cdot], \rho)$  is a Lie algebroid over  $M$  and  $\theta$  is a 1-cocycle,
- (ii)  $(\tilde{A}, [\cdot, \cdot]^{*\theta}, \rho^{*\theta})$  is a Lie algebroid over  $M \times \mathbb{R}$ ,
- (iii)  $(\tilde{A}, [\cdot, \cdot]^{-\theta}, \rho^{-\theta})$  is a Lie algebroid over  $M \times \mathbb{R}$ .

LEMMA 5. [2] If  $((A \times \mathbb{R}, [\cdot, \cdot]^{-\theta}, \rho^{-\theta}), (A^* \times \mathbb{R}, [\cdot, \cdot]_*^{*W}, \rho_*^{*W}))$  is a Lie bialgebroid (over  $\tilde{M} = M \times \mathbb{R}$ ), then  $((A, \theta), (A^*, W))$  is a Jacobi bialgebroid (over  $M$ ), and conversely.

THEOREM 6. Let  $(M, \Lambda, E)$  be a Jacobi manifold and  $\mathcal{N} =: (N, Y, \gamma, g)$  a Nijenhuis operator on  $M$ . Then  $(M, (\Lambda, E), \mathcal{N})$  is a strict Jacobi-Nijenhuis manifold if and only if the pair

$$(((TM \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}, \pi \circ \mathcal{N}), (\gamma, g)), ((T^*M \times \mathbb{R}, [\cdot, \cdot]_{(\Lambda, E)}, \pi \circ (\Lambda, E)^\sharp), (-E, 0))) \quad (23)$$

is a Jacobi bialgebroid.

*Proof:* From Proposition 2,  $(M, (\Lambda, E), \mathcal{N})$  is a strict Jacobi–Nijenhuis manifold if and only if  $(\tilde{M}, \tilde{\Lambda}, \tilde{\mathcal{N}})$  is a Poisson–Nijenhuis manifold, which is equivalent to the fact that the pair  $((T\tilde{M}, [\cdot, \cdot]_{\tilde{N}}, \tilde{N}), (T^*\tilde{M}, [\cdot, \cdot]_{\tilde{\Lambda}}, \tilde{\Lambda}^\sharp))$  is a Lie bialgebroid over  $\tilde{M} = M \times \mathbb{R}$  (cf. Theorem 1).

Now, using Lemma 4 and taking into account that the map

$$\psi : (T\tilde{M}, [\cdot, \cdot]_{\tilde{N}}, \tilde{N}) \rightarrow ((TM \times \mathbb{R}) \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}^{-(\gamma, g)}, (\pi \circ \mathcal{N})^{-(\gamma, g)}),$$

$\psi(\tilde{X} + \tilde{f} \frac{\partial}{\partial t}) = (\tilde{X}, \tilde{f})$ , and its adjoint,

$$\psi^* : ((T^*M \times \mathbb{R}) \times \mathbb{R}, [\cdot, \cdot]_{(\Lambda, E)}^{*(-E, 0)}, (\pi \circ (\Lambda, E)^\sharp)^{*(-E, 0)}) \rightarrow (T^*\tilde{M}, [\cdot, \cdot]_{\tilde{\Lambda}}, \tilde{\Lambda}^\sharp),$$

$\psi^*(\tilde{\alpha}, \tilde{f}) = \tilde{\alpha} + \tilde{f} dt$ , are Lie algebroid isomorphisms, we may conclude that

$$(((TM \times \mathbb{R}) \times \mathbb{R}, [\cdot, \cdot]_{\mathcal{N}}^{-(\gamma, g)}, (\pi \circ \mathcal{N})^{-(\gamma, g)}), ((T^*M \times \mathbb{R}) \times \mathbb{R}, [\cdot, \cdot]_{(\Lambda, E)}^{*(-E, 0)}, (\pi \circ (\Lambda, E)^\sharp)^{*(-E, 0)}))$$

is a Lie bialgebroid over  $\tilde{M} = M \times \mathbb{R}$  if and only if  $(M, (\Lambda, E), \mathcal{N})$  is a strict Jacobi–Nijenhuis manifold. Finally, from Lemma 5, we get the desired result.  $\square$

**PROPOSITION 7.** *The Jacobi structure induced on  $M$  by the Jacobi bialgebroid  $((TM \times \mathbb{R}, (\gamma, g)), ((T^*M \times \mathbb{R}, (-E, 0)))$  coincides with the one defined by  $(\Lambda_1, E_1)^\sharp = \mathcal{N} \circ (\Lambda, E)^\sharp$ .*

*Proof:* Taking into account (6) and (13), and also the equality  $\langle \gamma, E \rangle = 0$  [14] we have, for all  $f, h \in C^\infty(M)$ ,

$$\begin{aligned} \{f, h\} &= \langle d_{\mathcal{N}}^{(\gamma, g)} f, d_*^{(-E, 0)} h \rangle \\ &= \langle df, (-N\Lambda^\sharp + Y \otimes E)dh \rangle - h \langle df, NE \rangle + f \langle dh, \Lambda^\sharp(\gamma) + gE \rangle. \end{aligned}$$

Since  $N\Lambda^\sharp - Y \otimes E = \Lambda_1^\sharp$  and  $\Lambda^\sharp(\gamma) + gE = NE = E_1$  (see [14]), the proof is complete.  $\square$

A natural question that arises is the following: can we also establish, for the weak Poisson–Nijenhuis manifolds and for the Jacobi–Nijenhuis manifolds, a similar characterization, using the Lie algebroids theory? We postpone the answer for a subsequent paper.
